1 Introduction

This paper introduces various algorithms used in our research.

2 Asynchronous Baseline Algorithm

Below is a table of symbols used in the algorithms:

Symbol	Description
J	Number of classes
T	Global rounds
E	Edge rounds
K	Local epochs
L	Number of edge servers
B	The buffer of the cloud server with a static length
N^l	Number of clients in the l-th each edge server
$D_{i,j}$	A subset of the local dataset D_i of the i-th client, containing training instances of class j.
$\mathcal{N}_j^l$	Number of clients in edge l containing class j that have participated in aggregation
$\mathcal{N}_j^{l,\text{old}}$	Last number of clients in edge l containing class j that have participated in aggregation
S^l	Set of clients participating in training in the l-th edge server
$\bar{C}_j$	Aggregated prototype of class j in the cloud edge server
C_j^l	Aggregated prototype of class j from the l-th edge server
$C_j^{l,\text{old}}$	Last version of aggregated prototype of class j from the l-th edge server stored in the cloud server
$c_{i,j}^l$	Aggregated prototype of class j from the client i in the l-th edge server
$c_{i,j}^{l,\text{old}}$	Last version of the aggregated prototype of class j from client i in the l-th edge server stored in the edge server

Table 1: Symbol Table

The following algorithm demonstrates how to calculate the factorial of a number.

Algorithm 1 Hierarchical Federated Prototype Learning -Part 1

procedure CLOUD SERVER EXECUTES
  Initialize weights for clients with heterogeneous models.
  All edge servers execute in parallel.
  for $t = 1, \ldots, T$ **do**
    Clear the buffer B
    while B is not full **do** ▷ Async process
      Receive a triple $(C^l, \mathcal{N}^l, \mathcal{X}^l)$ from one edge server.
      Populate B with the received triple.
    end while
    $\bar{C}, G \leftarrow \text{CloudUpdate}(B)$
    Send $\bar{C}, G$ to edge servers participating in the current global aggregation.
    These edge servers re-execute.
  end for
end procedure
procedure EDGE SERVER EXECUTES
  Receive $\bar{C}, G$ from the cloud server
  Choose a set of clients S^l to train in parallel.
  for $e = 1, \ldots, E$ **do** ▷ E now is static 1
    Send $\bar{C}, G$ to client $i \in S^l$
    for each client i in parallel **do**
      $(c_i^l, \mathcal{X}_i^l) \leftarrow \text{ClientUpdate}(i, \bar{C}, G)$
    end for ▷ Wait for all clients
    $(C^l, \mathcal{N}^l, \mathcal{X}^l) \leftarrow \text{EdgeAggregate}(\{(c_i^l, \mathcal{X}_i^l)\}_{i \in S^l})$
    $\bar{C} \leftarrow \text{EdgeUpdate}(\bar{C}, C^l)$ ▷ not used now
  end for
  Send a triple $(C^l, \mathcal{N}^l, \mathcal{X}^l)$ to the cloud server
end procedure

Algorithm 2 Hierarchical Federated Prototype Learning -Part 2

procedure CLOUDUPDATE(B)
  for $j = 1, \ldots, J$ **do**
    $\hat{C}_j \leftarrow \sum_{l=1}^{L} \mathcal{N}_j^{l,\text{prev}} \cdot \bar{C}_j$ ▷ Extend the aggregated prototypes $\bar{C}$
    for $(C^l, \mathcal{N}^l) \in B$ **do**
      $\hat{C}_j \leftarrow \hat{C}_j + \mathcal{N}_j^l \cdot C_j^l$
      if $C_j^{l,\text{prev}}$ is not empty **then**
        $\hat{C}_j \leftarrow \hat{C}_j - \mathcal{N}_j^{l,\text{prev}} \cdot C_j^{l,\text{prev}}$
      end if
      $\mathcal{N}_j^{l,\text{prev}} \leftarrow \mathcal{N}_j^l$
    end for
    $\bar{C}_j \leftarrow \frac{\hat{C}_j}{\sum_{l=1}^{L} \mathcal{N}_j^{l,\text{prev}}}$
  end for
  $C^{l,\text{prev}} \leftarrow C^l$ for $l \in B$
  $\mathcal{X}^{l,cloud} \leftarrow \mathcal{X}^l$ for $l \in B$
  $\mathcal{X} \leftarrow \bigcup_{l \in L} \mathcal{X}^{l,cloud}$
  Train the global classifier G by using $\mathcal{X}$.
  return $\bar{C}, G$
end procedure
procedure EDGEAGGREGATE($l, \{(c_i^l, \mathcal{X}_i^l)\}_{i \in S^l}$)
  for $j = 1, \ldots, J$ **do**
    $\hat{C_j^l} \leftarrow \mathcal{N}_j^l \cdot C_j^l$
    for each c_i^l **do**
      $\hat{C_j^l} \leftarrow \hat{C_j^l} + c_{i,j}^l$
      if $c_{i,j}^{l,\text{prev}}$ is not empty **then**
        $\hat{C_j^l} \leftarrow \hat{C_j^l} - c_{i,j}^{l,\text{prev}}$
      else
        $\mathcal{N}_j^l \leftarrow \mathcal{N}_j^l + 1$
      end if
    end for
    $C_j^l \leftarrow \frac{\hat{C_j^l}}{\mathcal{N}_j^l}$
  end for
  $c_i^{l,\text{prev}} \leftarrow c_i^l$ for $i \in S^l$
  $\mathcal{X}_i^{l,edge} \leftarrow \mathcal{X}_i^l$ for $i \in S^l$
  $\mathcal{X}^l \leftarrow \bigcup_{i \in N^l} \mathcal{X}_i^{l,edge}$
  return $(C^l, \mathcal{N}^l, \mathcal{X}^l)$
end procedure
procedure CLIENTUPDATE($i, \bar{C}, G$)
  Receive $\bar{C}, G$ from the edge server
  for $k = 1, \ldots, K$ **do**
    DVFS to be implemented...
    for batch $(x, y) \in D_i$ **do**
      Compute client prototypes by Eq.?.
      Compute loss by Eq.? using client prototypes and the global classifier G.
      Update client model according to the loss.
    end for
    Store the features and labels of D_i in $\mathcal{X}_i^l$.
  end for
  return $(c_i^l, \mathcal{X}_i^l)$
end procedure

3 Proposed Algorithm
